## Polyester Powdercoat

### Method

A thin layer of free-flowing dry plastic powder is applied electrostatically to the surface of a metal element which is then 'baked' to cure the plastic into a tough plastic skin

### Durability

Moderate durability however if damaged it would allow the substrate to corrode if it's not galvanised

### Life Span

Up to 10 years

### Maintenance

Not required

### Recycled

Powder coated elements can be recycled - depends on substrate material.

### Repair

For light damage (scratches, chips etc.) repairs can be carried out using touch-up paint to match original colour.

### Comments

Our powder coating is always a double coat system with a zinc rich primer and a second topcoat and we regularly coat with any RAL colour or Interpon ranges
