

FACTORY FURNITURE

Zinc Plate / Electrogalvanising

Method

The steel component is given a thin coating of zinc using an electrochemical process.

Durability

Moderately durable if also powder coated

Life Span

Up to 10 years

Maintenance

Not required

Recycled

Galvanised steel is widely recycled

Repair

Scratches or denting that penetrate the zinc layer and expose the mild steel beneath can be repaired using a high performance cold galvanising zinc spray (70% zinc or above).

Comments

Not to be confused with hot dip galvanising - zinc plating gives a thinner but cleaner, more even zinc coat finish. Zinc plating does not offer any long-term protection to steel as a standalone process and should be combined with a paint or powder coat finish
